How to use this document

One block per slide. The title is to be reused as is, the content is to be pasted into Canva, and the **Layout** line says how to arrange it. The **Say this** note does **not** go on the slide — it belongs in your speaker notes.

Nine of those 31 slides are section dividers

They take three seconds each and cost you nothing in time, but they are what makes a deck read as deliberate rather than assembled. Effective content: 20 slides, about 18 minutes.

Figures

All taken from the database or from a test run on 3 October 2026. They are verifiable: an examiner may ask for the source.

SECTION 0

Canva build sheet

Read this before you place the first slide

The template to start from

In Canva, open **Presentations** and search dark blue minimalist thesis defense. Pick a template whose title contains **Dark Blue** and **Minimalist** — for example “*Dark Blue and White Minimalist Simple Thesis Defense Presentation*”. Two reasons: it already carries a dark divider layout and a light content layout, which is exactly the alternation this deck uses, and its near-black and blue palette is a two-click match for Quicky Prime's own branding.

Avoid the “futuristic / neon tech” family. Glow effects and circuit-board backgrounds read as decoration, and a jury reads decoration as a thin argument underneath.

Override the template's colours with these

Role	Hex	Used for
Ground / dividers	#0C2340	Section divider slides, the two breather slides
Accent	#1F6FEB	Numerals, rules, key figures, table headers
Ink	#0B0F14	Body text on light slides
Wash	#E8F0FE	Card and callout backgrounds
Paper	#FFFFFF	Content slide background

Fonts — headings **Poppins SemiBold**, body **Inter** or **Source Sans Pro**. Body never below 16 pt: at 14 pt the back row of the room stops reading and starts waiting.

The one rule that matters more than the template

One idea per slide. Every slide in this document carries a single argument, and the Layout line tells you how to give that argument the whole frame. A beautiful template cannot rescue a slide with four arguments on it.

SECTION 1

Host organisation

2 slides · keep this under two minutes

Slide 1.1

Quicky Prime

Content for the slide

Name	Quicky Prime
Positioning	“AI That Acts, Not Just Talks”
Sector	IT system design services
Locations	Morlaix (France) and Sousse (Tunisia)
Size	A small team — 2 to 10 people
Also operates	Sawti (□□□□), a showcase brand of the same company

To verify before you present — do not invent any of it

Year founded, the exact client sectors, and the headcount today. Everything above comes from the company's public LinkedIn page, which is enough for a slide but is not the company's own words. Ask your supervisor to read this slide once.

Layout — logo top left, the table as five short lines, generous white space. No stock photography of an office.

Say this

A small AI-focused firm working across France and Tunisia. Say it in two sentences and move on: this section is expected, but it earns no technical marks, and a jury that is still hearing about the host company at minute four starts to worry about the other eight sections.

Slide 1.2

The assignment

Content for the slide

- **Department and supervisor** — name and role (*fill this in; it is not in the code*)
- **Period** — dates of the internship
- **The brief** — design and build a platform that lets a property company lease office space to other companies, from the first public enquiry through to the collected rent
- **The constraint that shaped everything** — the platform had to host **several competing property companies on one installation**

Say this

End on the last bullet and pause. It is the sentence that carries you into section 2, and the jury should hear it twice: once here, once in the problem statement.

SECTION 2

Problem statement

3 slides · the section that sets up everything else

Slide 2.1

The business: leasing offices in Doha

A property company owns office towers and leases workspace to other businesses: private offices, dedicated desks, meeting rooms, event spaces.

Actor	What they do
The landlord	Owns the buildings. Lists, reviews, approves, invoices, collects.
The renter	Occupies the space. Books, signs, pays, reports faults.
Operations staff	Reception (calls, viewings), technicians, finance.

Two rules specific to the Qatari market

- A lease is concluded **in person**: confirmation call, site visit, paper file, and only then a signature
- Rent is **not paid online**: cash, bank transfer or cheque

Layout — three actor cards across the top, the two market rules as a highlighted strip underneath.

Say this

The two market rules are not trivia. They are why no product on the market fits, and you will reuse them in section 3. Plant them here.

Slide 2.2

What the current way of working costs

Today the work is done in spreadsheets, email and paper.

Weakness	What it costs
Availability is uncertain	No single source of truth; two people promise the same room
Manual collections	Due dates tracked from memory; payment delays stretch out
Faults leave no trace	No resolution time, no cost, no history per space
No audit trail	Impossible to establish who approved what, and when — a real problem in a dispute

Layout — four numbered cards in a row, the way a process diagram reads. Number, short title, one sentence.

Say this

Do not linger. This slide exists so the jury feels the cost before you state the problem on the next one.

Slide 2.3

The question this project answers

Put this sentence on the slide, and almost nothing else

*How do you build a **single platform** that serves **several competing property companies**, honours a commercial process conducted face to face, and guarantees that **no organisation ever sees another's data**?*

Three difficulties it contains

- **Isolation.** Two competitors on one installation: not a row, not a total, not a counter in common
- **Process.** Represent a face-to-face sequence that existing products ignore entirely
- **Model.** One record belongs to two organisations by two different paths

Layout — dark background #0C2340, the question large and centred, the three difficulties small beneath it.

Say this

Deliver the question slowly, then stop talking for two seconds. This is the sentence the jury will measure the remaining eight sections against.

SECTION 3

Study and critique of existing solutions

3 slides · this is where you prove you looked

Slide 3.1

The platforms that already manage flexible workspace

Product	What it does	Limitation here
Nexudus UK · coworking	Member portal, bookings, recurring billing, white-label	Built around one operator ; assumes card payment
OfficeRnD Flex Bulgaria / UK	Flex-space management, members, contracts, integrations	Per-member pricing; a fully digital journey is assumed
Yardi Kube United States	Coworking plus commercial property, accounting built in	Enterprise weight and cost for a three-building portfolio
Optix Canada	Mobile-first member app, bookings, payments	Light on lease contracts; member experience, not landlord back-office

Layout

A four-row table is the right shape here — a jury expects a benchmark to look like a benchmark. Keep the product names bold and the limitation column the widest.

Say this

Name the products out loud. A benchmark with no names reads as a benchmark you did not actually run.

Slide 3.2

The four gaps they share

Gap	Consequence for this project
A single level of client	They separate the operator from its members, but not who owns the walls from who occupies them → competing landlords cannot be hosted together
Online payment assumed	Unsuited to a market that settles in cash, transfer or cheque
Fully digital intake	No confirmation call, no site visit, no paper file — the actual sequence here
Per-user pricing	Prohibitive for a company with a large operations staff who each touch the system a few times a week

Say this

The first row is the decisive one — it is what justifies the project existing at all. Do not let it pass as one row among four: say it, then say why it cannot simply be configured around.

Slide 3.3

What follows from that

Breather slide — dark background, one sentence

Two competing companies, one installation, zero shared data.

Not a row, not a total, not a counter. This requirement, rather than the feature list, is what shapes the architecture in the next section.

Layout — background #0C2340, white text, one sentence at large size. No bullets, no image, no logo.

Say this

The hinge of the whole talk. Two seconds of silence before you click on.

Proposed solution

4 slides · your contribution beyond the brief

Slide 4.1

A three-level tenancy model

The specification called for multi-tenancy at **one level**. The business turned out to require **two, nested**.

Level	Actor	What they can see
1	Platform owner	Operates the service. The only role that reads across organisations.
2	Property company (landlord)	Buildings, floors, spaces. Lists, approves, invoices, collects. Its own portfolio only.
3	Renter company	Books, signs, pays, reports. Its own data, plus the public listings.

In the database this is one column: `tenants.organization_type` { CLIENT, RENTER }

Layout — three stacked bands, widest at the top, narrowing down. The nesting should be visible before anyone reads a word.

Say this

Present this as analysis that reshaped the model, not as a deviation you were forced into. You read the brief, you found it modelled one level, and the business needed two.

Slide 4.2

The central difficulty — give this slide the most time

A booking, or a maintenance ticket, belongs to **two organisations** by **two different paths**.

THE RENTER	THE LANDLORD
tenant_id carried on the row itself	space → floor → building.tenant_id
<i>“I am the one who booked it”</i>	<i>“those are my walls”</i>

The line that closes the slide

*Confusing these two paths is the origin of all **nine cross-tenant defects** found and fixed during development.*

Layout — one booking record in the centre, two arrows reaching it from opposite sides, each labelled with its path. This is the one slide worth drawing by hand in Canva rather than filling a template box.

Say this

The most important slide in the presentation. Trace both arrows with your finger on the screen while you say them. If the jury understands only one slide today, make it this one.

Slide 4.3

How the rule is enforced, on every single route

#	Stage	What it does
1	JwtAuthGuard	Validates the token, populates the caller's identity
2	RolesGuard	Checks <code>@Roles(...)</code> against the caller's role
3	ValidationPipe	Rejects unexpected fields rather than ignoring them
4	Controller → *ForUser	Never the unscoped method
5	AccessPolicyService	Turns the caller into a database filter

`isCrossTenantReader()` returns true for the platform owner alone. Every other caller is narrowed to their own organisation before the query is built.

Layout — five stages as a horizontal chain of arrows, numbered.

Say this

Five stages, one request. Understanding this chain is understanding the security of the whole back end — say that sentence, it gives the jury a handle.

Slide 4.4

Deployment architecture

Browser → nginx → React SPA (built)
 ↳ NestJS API → Prisma → PostgreSQL
 ↳ Socket.IO (live notifications)

Four containers · one origin · no CORS · no hostname compiled into the bundle · one command to start

Image: docs/diagrams/09-deployment.png

Say this

The point to land is one command. A jury hears “it runs on my machine” often; a reproducible stack is worth saying out loud.

SECTION 5

Functional and non-functional requirements

5 slides · the section that carries the mark

Slide 5.1

Coverage of the specification

§	Module	State
3.1	Authentication & accounts	Complete
3.2	Space management	Complete
3.3	Catalogue & pricing	Complete
3.4	Availability & bookings	Complete
3.5	Leases / contracts	Complete
3.6	Invoicing & payments	Complete
3.7	Maintenance & tickets	Complete
3.8	Notifications	Complete
3.9	Reporting & dashboards	Complete
3.10	Administration & audit	Complete

30 controllers · 218 routes · 25 data models

Layout — two columns of five rows, with a green tick against each. The three figures as large numerals along the bottom.

Say this

Ten for ten. Say it once, do not read the rows aloud — the jury can read faster than you can speak.

Functional requirements — the parts worth stopping on

Bookings (§3.4) — twelve states, not four

- The specification implies submit → approve → occupy
- Reality inserts a whole phase: confirmation call → site visit → document upload → only then a signature
- **Double-booking is prevented** by an overlap check before the write, not by a warning afterwards

Pricing (§3.3) — promotion codes unique per company

- Two landlords can both run a code called SUMMER25 without collision — a direct consequence of the three-level model

Payments (§3.6) — cash, bank transfer, cheque

- Recorded by a named member of staff, with the audit trail that implies
- No online payment: a deliberate decision, covered on slide 5.4

Maintenance (§3.7)

- Reporting is limited to spaces the reporter **actually occupies** — an isolation rule hiding inside a feature

Say this

Pick the twelve-state booking and spend thirty seconds there. It is the clearest evidence that you modelled a real market rather than a generic one.

Non-functional requirements

Requirement	How it is met	Evidence
Authentication	JWT with refresh, per-device sessions	—
Access control and isolation	@Roles on every route, plus AccessPolicyService	43 probes
Input validation, injection safety	Unknown fields rejected; every query parameterised by the ORM	Unknown field → 400
Rate limiting	Throttling on public endpoints	—
Audit logging	Append-only log: actor, IP, severity	—
Performance	Pagination, TTL cache, request de-duplication	—
Reliability	Runs with no external keys at all ; mail degrades through three tiers	—
Maintainability	Modular back end, CI/CD, Swagger	252 tests
Usability	Responsive, light and dark themes, per-tab sessions	—

Say this

Two cells carry this slide: **43 probes** and **252 tests**. Everything else is a claim; those two are measurements.

Where I deliberately departed from the specification

The specification says	Decision	Why
Online payment (Stripe), marked <i>optional</i>	Dropped	The Qatari market settles in cash — a constraint given by the industrial supervisor
Supabase for auth and storage	Replaced with Passport-JWT, Prisma and Cloudinary	Supabase's row-level security reasons about one tenant id; here one row belongs to two organisations by two paths
BullMQ + Redis, marked <i>optional</i>	Not adopted	Three daily jobs → the framework's own scheduler is enough, and one fewer moving part
QR check-in, recurrence, SLA	Not implemented	All marked <i>optional</i> in the specification

Added beyond the specification: three AI features · a public space-finding assistant · live notifications · an automated isolation audit

Say this

The slide that decides your mark. It proves you read the specification and reasoned about it instead of following it blindly. Rehearse the Supabase answer until it is one fluent sentence — it is the question a technical examiner will ask.

Slide 5.5

Proving the isolation — your strongest slide

Correct isolation does not merely hide rows. It **partitions** them.

Measure	Msheireb	West Bay	Lusail	Platform
Revenue collected (QAR)	5,300	11,800	10,100	27,200
Bookings	6	6	6	18
Spaces	24	24	24	72
Maintenance tickets	18	18	18	54

The conclusion to put on the slide

*The three portfolios add up to **exactly** the platform total. If a row leaked into the wrong portfolio, or were counted twice, the sum would not close. Security becomes an arithmetic property anyone in this room can check.*

Layout — the table, then the total column emphasised in the accent blue. Consider animating the total column in last.

Say this

Do the addition out loud on the first row: five thousand three hundred, plus eleven thousand eight hundred, plus ten thousand one hundred — twenty-seven thousand two hundred. It takes six seconds and it is the most convincing thing you will say all day.

SECTION 6

Technologies used

2 slides

Slide 6.1

One TypeScript stack, end to end

Layer	Technologies
Server	NestJS 11 · Prisma 5 · PostgreSQL 13 · Passport-JWT · Socket.IO
Client	React 19 · Vite 7 · TypeScript · Ant Design 6 · TanStack Query · Recharts · Leaflet
Infrastructure	Docker Compose · nginx · GitHub Actions
External services	Groq (LLM) · Brevo (email) · Cloudinary (files) · Typeform (applications)

The argument, not the list

One language on both sides of the wire. The types that describe a booking on the server are the same types the browser compiles against, which removes an entire category of error — the kind where each side believed something different about the same field.

Layout — four bands with logos. Logos are the one place in this deck where decoration genuinely helps.

Slide 6.2

Why these choices

Choice	Reason
NestJS	Its guard mechanism suits declarative access control, route by route — which is exactly the problem this project has
Prisma	Typed database access and migration tooling; queries are parameterised, so injection is not reachable
Ant Design	Covers back-office components without bespoke development
nginx in front	Serves the built application and proxies the API on the same origin: no CORS configuration at all
Configurable LLM client	The provider URL is a setting — changing provider is configuration, not a rewrite

Say this

Only the first row needs saying aloud. A jury rewards a choice made for the problem at hand over a choice made because it is popular.

Design

3 slides · two diagrams, no more

Slide 7.1

Use case diagram

Image to insert

docs/diagrams/01-use-case-global.png — portrait format. On a 16:9 slide, centre it under the title and leave the sides empty. Do not stretch it to fill the width.

What it shows

- **9 actors** across the three tenancy levels
- **10 use cases** grouped by domain
- Two **generalisation** relationships: the tenant admin inherits from the employee, the client admin from the manager

Say this

Point at the receptionist. It is the actor most systems do not have, and it exists only because a lease here is concluded in person — which ties section 7 straight back to section 2.

Slide 7.2

Class diagram

Image to insert

*docs/diagrams/02b-class-diagram-presentation.png — the **landscape, reduced** version, built for projection: 10 classes, 3 attributes each. The full diagram (02-class-diagram.png, 17 classes) is unreadable on a screen; keep it for the written report.*

Point at exactly three things

- The composition chain **Tenant** → **Building** → **Floor** → **Space** — the landlord's path
- The `tenant_id` on **Booking** and **MaintenanceTicket** — the renter's path
- The note attached to Booking, which states the duality in one line

Say this

This is slide 4.2 again, now in UML. Say so explicitly — “this is the same duality, drawn formally” — so the jury sees the deck hang together.

One sequence diagram — choose before the day

File	What it shows	Choose it if
04-sequence-authorisation.png	The five authorisation stages of one request, with the refusal branches	The panel is technical — this is the core of the security model
06-sequence-booking.png	Public enquiry through to signed lease, with the role driving each step	The panel is business-minded — this is the full operational journey

All nine diagrams are in docs/diagrams/, as PNG and as editable source.

Say this

Do not project more than two diagrams in the whole talk. A jury disengages in front of a run of dense schematics, and one diagram explained well is worth more than four shown quickly.

Progress

3 slides · be straight about what is not done

Slide 8.1

The project in figures

25	30	55	9	252	43
data models	controllers	pages	roles	tests	audit probes

Layout — six tiles, the numeral very large in the accent blue, the label small beneath. This is the slide that conveys scale, so give the numbers room and resist adding a seventh.

Overall state

- Continuous integration green
- Type checking clean on both projects
- Full deployment from a single command

Say this

Let the slide do the talking. Two sentences, then move on.

Slide 8.2

What is finished

The complete business chain

- Application → booking → lease → invoice → payment, end to end
- Maintenance, live notifications, audit trail
- Dashboards and analytics per role

Isolation

- All three levels in place and verified
- **9 defects found and fixed**
- Arithmetic consistency check (slide 5.5)

Artificial intelligence — beyond the specification

- Automatic ticket triage: category, priority, suggested technician
- A space-finding assistant for visitors, in plain language
- Reading of administrative documents (trade licence, commercial registration)

The principle to state out loud

The model proposes, it does not decide. Any value outside the application's own list is discarded and a keyword classifier takes over. The suggested technician comes from ticket history, not from the model — a model asked to name a person invents people who do not work here.

What is not done yet

Outstanding	State	Reason
Document-reading interface	Server only	Extraction works; the drag-and-drop into the form remains to be built
Scanned documents	Limited	The configured AI provider exposes no vision model
External marketplaces	Waiting	Adapters written, credentials not yet supplied
Google Business profile	On hold	Requires a verified account held by the property owner
Production email	Degraded mode	Server address to be allow-listed with the provider; fallback active
Mobile application	Out of scope	The web interface is responsive

The line that turns this slide to your advantage

None of these blocks a business journey: each has either a degraded mode or a manual equivalent already in place.

Say this

Do not rush or soften this slide. A clear-eyed progress report earns more credit than a list where everything is declared finished — and a jury that finds the gap you did not mention will go looking for others.

Conclusion and perspectives

3 slides

Slide 9.1

The finding worth taking away

Put this on a dark slide, and nothing else

None of the nine defects came from a broken security function. Every one came from a call site that forgot to use it.

And four stayed invisible while the test data held a single landlord: with one, “show everything” and “show my portfolio” return the same rows.

→ **The shape of your test data is part of the security surface.**

Layout — background #0C2340, white text, no image.

Say this

The turning point of the defence. Deliver it slowly. This is an engineering result rather than a feature, and it is the moment a jury stops hearing a student describe a project and starts hearing an engineer describe a finding.

Slide 9.2

Assessment

- A platform that works from anonymous visitor through to platform owner
- An isolation model that is **demonstrable**, not merely asserted
- AI that is useful and bounded: it proposes, it does not decide
- A deployment reproducible from one command

Layout — four short lines, generous spacing. No table.

Slide 9.3

Perspectives

- Build the document upload interface, then move to a vision model for scans
- Extend the conversational assistant to the renter's own data, with a suite of injection tests to demonstrate its limits
- Replace the maintenance heuristic with a model trained on ticket history, measured against that heuristic as the baseline
- A mobile application for technicians working in the buildings

Say this

Each perspective names how it would be judged, not just what would be built. That distinction is what separates a perspective from a wish list.

Closing slide

Thank you for your attention

Then a second line: **Questions.**

Footer, small: *LeaseManager — office lease management platform · Quicky Prime · ESPRIT 2026*

Figures taken from the database and from a test run on 3 October 2026. Images referenced are in docs/diagrams/. Company details on slide 1.1 come from Quicky Prime's public LinkedIn page and should be confirmed with your supervisor; the supervisor's name and the internship dates are not in the code and must be filled in by hand.
