LEASEMANAGER · FIRST REVIEW · ESPRIT × QUICKY PRIME

Deck revision guide

What to change in the 30-slide deck, slide by slide, with text ready to paste into Canva.

Reviewed: *LeaseManager — Final Year Project Presentation (ESPRIT 2026)*, 30 slides. Every figure in this guide was checked against the code and the running application on **7 October 2026**.

HOW TO USE THIS GUIDE

MUST A jury member could catch it, or the jury expects to see it. Fix all of these.

SHOULD Makes your argument noticeably stronger. Do these if you have time.

NICE Polish.

- **Blue boxes** hold text written for the slide. Copy it as it is.
- **Purple boxes** need facts only you have (dates, method, names). Nothing was invented to fill them.
- **Orange boxes** are warnings: things a jury member is likely to challenge.
- Slide numbers in Part A refer to **your current deck**. Part C gives the new order once the new slides are added.

ALL CHANGES AT A GLANCE

ID	Where	Change	Priority
A1	Title slide	Check the dates against when the security work was done	SHOULD
A2	Slide 2	Agenda: add Work methodology and Demo, 10 sections	MUST
A3	Slide 4	Quicky Prime: locations, get the supervisor to confirm	NICE
A4	Slide 9	Remove “assumes card payment”, add sources	MUST
A5	Slide 10	Rewrite the gaps: drop the payment gap, restate the decisive one	MUST
A6	Slide 12	Explain what “tenant” means in your code	MUST
A7	Slide 13	Make the root cause agree with slide 28	MUST
A8	Slide 14	Show which boxes are which containers	SHOULD
A9	Slide 17	43 → 42 probes, fill or drop the Evidence column	MUST
A10	Slide 19	Show the full stack, name the LLM	SHOULD
A11	Slide 21	Fix the arrow from Tenant admin to “Invoice and collect”	NICE
A12	Slide 24	43 → 42 audit probes	MUST
A13	Slide 25	Document reading: say “server side”, to match slide 26	MUST
A14	Slide 26	Fix the vision-model claim, name the marketplaces	MUST
A15	Slide 29	Mention the injection probes you already have	NICE
B1	New slide	The business: leasing offices in Doha	MUST
B2	New slide	Work methodology and timeline	MUST
B3	New slide	How the rule is enforced (sequence diagram)	SHOULD
B4	New slide	Where I departed from the specification	SHOULD
B5	New slide	The life of a booking (state diagram)	SHOULD
B6	New slide	Proving the isolation (the arithmetic)	SHOULD
B7	New slide	One of the nine defects, concretely	SHOULD
B8	New slide	Live demo, plus backup screenshots	MUST
D	Backup	Slides kept after Questions, and the likely questions	NICE

WHAT I CHECKED

The figures on your slides, verified

Most of the deck is accurate. The rows in red are the ones to fix. Each one is covered in Part A.

Claim on the deck	Slides	Result	How it was checked
25 data models / tables	14, 24	**Correct**	Models in `schema.prisma`
30 controllers	24	**Correct**	`*.controller.ts` files
55 pages	24	**Correct**	Page components in `frontend/src/pages`
9 roles	24	**Correct** (GUEST, the visitor, is one of them)	`USER_ROLE` in `constants/enums.ts`
12 booking states · 7 space types	16, 22	**Correct**	`BOOKING_STATUS`, `SPACE_TYPE`
252 automated tests	17, 24	**Correct**	Ran jest: 252 passed, 252 total
NestJS 11 · Node 20	14	**Correct**	`package.json`, Dockerfiles
Revenue 5,300 + 11,800 + 10,100 = 27,200 QAR	new B6	**Correct** (on 7 Oct; it moves, see B6)	Live API, signed in as each landlord
43 audit probes	17, 24	**Wrong: 42**	Ran `npm run audit:access` and counted the checks
"Four containers"	14	**Count right, drawing unclear**	`docker-compose.yaml`: web, api, postgres, adminer
"Assumes card payment" / "Online payment assumed"	9, 10	**Contradicted**	Nexudus and OfficeRnD Flex document manual payments (sources at the end)
"The AI provider exposes no vision model"	26	**Inaccurate**	The configured model is text-only; Groq offers vision models
"All nine defects" came from confusing the two paths	13	**Disagrees with slide 28**	Git history: some fixes have nothing to do with the two paths

SEEN WHILE CHECKING

Running the isolation audit several times within a few minutes trips the rate limiter on the public assistant. On my third run today, the four prompt-injection checks showed **FAIL** with HTTP 429. That isn't a leak, but on a projector it looks like one. Run the audit **once** before the session (see Part D).

PART A

Fixes to the slides you already have

In the order of your current deck. Slides not listed here can stay as they are, apart from renumbering the section dividers (see A2).

A1 · Title slide

Check the dates

SHOULD

The title says **15 February – 15 August 2026**. Your git history dates the isolation fixes and the audit script **10–21 September 2026**, and your demo script was rehearsed on 21 September. If the jury asks when you did the security work, your answer has to match the title slide and your timeline (B2).

YOU FILL: ONLY YOU HAVE THESE FACTS

Check the dates against your internship agreement. If the work carried on after 15 August, say so on the timeline. Don't hide it.

A2 · Slide 2

Agenda: ten sections instead of nine

MUST

The agenda has no methodology and no demo. ESPRIT juries expect both, and the new slides in Part B need a place to go.

PASTE INTO THE SLIDE

01 Host organisation	06 Requirements
02 Context & problem statement	07 Technologies
03 Existing solutions	08 Design
04 Proposed solution	09 Progress & demo
05 Work methodology	10 Conclusion & perspectives

Then renumber every section divider and the small label at the top of each slide: "05 · REQUIREMENTS" becomes "06 · REQUIREMENTS", and so on. Change the subtitle on the 02 divider to *"The market, and the question this project answers"*.

A3 · Slide 4

Quicky Prime

NICE

Your own content notes list two locations, **Morlaix (France) and Sousse (Tunisia)**, but the slide shows only Sousse. Everything on this slide comes from LinkedIn.

- Ask Mr Amri which locations to show, and get him to read this slide once.
- Once he confirms, you can remove "Source: the company's public LinkedIn page". A confirmed fact doesn't need it.

PASTE INTO THE SLIDE (ONLY IF HE CONFIRMS BOTH)

LOCATIONS Morlaix (France) · Sousse (Tunisia)

A4 · Slide 9

The platforms already on the market

MUST

Nexudus: "assumes card payment" is contradicted by Nexudus's own documentation, which describes recording manual payments. OfficeRnD Flex also documents manual payments in cash, bank transfer, POS and cheque. A jury member who has used either product will correct you.

Yardi Kube: "a three-building portfolio" has not been introduced anywhere. If the real client has three buildings, say so on the new context slide (B1). If not, use "a small portfolio".

Every cell in the *Limitation* column should be something you could show from the vendor's own pages. Add a source line.

PASTE INTO THE SLIDE (LIMITATION COLUMN)

Product	Limitation for this project
Nexudus	Built for one coworking operator and its members
OfficeRnD Flex	Priced per member or per location; built for one operator
Yardi Kube	An enterprise suite: weight and cost out of proportion for a small portfolio
Optix	Member experience first; light on lease contracts and the landlord's back office

Footer: Sources: vendor documentation and pricing pages, consulted October 2026.

A5 · Slide 10

The gaps they share

MUST

Each of the four rows needs work:

- **"Online payment assumed"** is not true for OfficeRnD Flex or Nexudus (see A4). Remove this row. Your no-online-payment *decision* still stands, but it belongs in Requirements (slide 16 and B4), not in a list of competitor gaps.
- **"Competing landlords cannot be hosted together"** can be attacked: every product in the table is SaaS, so each already hosts thousands of competing operators, isolated from each other. What they don't have is the **extra, nested level**. Say that instead.
- **"Per-user pricing … a large operations staff"**: OfficeRnD's per-member price counts the operator's *members* (its customers), not its staff, so the argument as written doesn't match how they charge. Drop it, or rewrite it with a source.
- **"Fully digital intake"**: keep it only if you've checked it (a demo account, a product video or the docs). The version below says what LeaseManager does, which is safe either way.

PASTE INTO THE SLIDE (TWO ROWS)

Title: What they don't cover

Gap	Consequence for this project
One level of client THE DECISIVE ONE	They isolate one operator from another. Here there is a level below: a renter company is an organisation in its own right, with its own administrator, employees and history, while each landlord sees only its own buildings.
A face-to-face intake	Confirmation call, site visit, paper file, then a signature: the actual sequence in this market, modelled as booking states.

Two strong, defensible gaps are better than four that can be challenged. The space you free up makes the decisive one stand out more.

A6 · Slide 12

Say what “tenant” means in your code

MUST

The footnote reads *“tenants.organization_type, set to CLIENT or RENTER”*. In real estate, a *tenant* is the renter. Yet your `tenants` table holds landlords too, and a landlord is called `CLIENT`. The role names follow the same pattern: `CLIENT_ADMIN` is a landlord's admin, `TENANT_ADMIN` a renter's admin. The jury will trip over this as soon as they see `tenant_id` on the class diagram.

PASTE INTO THE SLIDE (REPLACES THE FOOTNOTE)

In the code, every organisation is a “tenant” in the software sense: one customer of the platform. `tenants.organization_type` tells them apart: **CLIENT** = property company (landlord) · **RENTER** = renter company

Say it aloud once: *“When you see ‘tenant’ in my diagrams, read ‘organisation’.”*

A7 · Slide 13

One record, two owners: make the root cause agree with slide 28

MUST

Slide 13 says confusing the two paths caused **all nine** cross-tenant defects. Slide 28 says every one came from **a call site that forgot to use** the security function. That's two different causes for the same nine defects. Your git history fits slide 28 better: some of the fixes (promotion codes scoped to their owner, an ownership check before writing uploaded files) have nothing to do with the two paths.

Keep slide 28 as the general rule, and make slide 13 claim less.

PASTE INTO THE SLIDE (BOTTOM BANNER)

Confusing these two paths is the easiest mistake to make and the hardest to see. It is behind several of the nine cross-tenant defects found during development.

A8 · Slide 14

Deployment architecture

SHOULD

The banner says **four containers**, but the drawing shows seven boxes without saying which is which. Socket.IO isn't a container: it runs inside the API. The React app isn't a server: nginx serves its built files. And the fourth container, Adminer (a database admin page), isn't drawn at all.

Draw a dashed outline around each container and label it:

PASTE INTO THE SLIDE

Container	What runs in it
web	nginx + the built React app. Proxies the API routes and `/socket.io` to the API
api	NestJS 11 on Node 20 · Socket.IO gateway · Prisma
postgres	PostgreSQL 13 · 25 tables
adminer	Database admin page (development tool)

Banner: Four containers · one origin · no CORS · no hostname compiled into the bundle · one command: `docker compose up`

WATCH OUT

Expect the question “Why is a database admin page in your stack?” Answer: it's in the development compose file only. `backend/docker-compose.prod.yaml` doesn't include it. Or leave Adminer off the slide and say “three application containers”.

A9 · Slide 17

Non-functional requirements

MUST

1. “43 probes” appears twice on this slide, in the badge and in the banner. The audit script runs **42** checks. I counted them in the script and in a live run (the breakdown is in backup slide X1). Change both.

2. Six of the nine Evidence cells are empty, so the column looks unfinished. Fill it with things you can show, or delete the column and keep the two numbers in the banner.

PASTE INTO THE SLIDE (EVIDENCE COLUMN AND BANNER)

Requirement	Evidence
Authentication	Self-promotion to SUPER_ADMIN refused
Access control & isolation	**42 probes**, all pass
Validation & injection safety	Unknown field → 400
Rate limiting	429 once the limit is reached
Audit logging	Shown in the demo
Performance	Average page load under 2 s (demo rehearsal, 21 Sept)
Reliability	—
Maintainability	**252 tests** · CI on pushes and pull requests
Usability	Shown in the demo

Banner: Backed by measurement, not only by design: 42 cross-tenant probes and 252 automated tests.

A10 · Slide 19

Technologies: show the whole stack

SHOULD

React, PostgreSQL, Socket.IO and Docker aren't on the slide, so the jury sees half the stack. Row 5 says “configurable LLM client” without naming the model, and you will be asked which one.

Add a band of logos above the five reasons (or a separate slide just before), and name the model in row 5:

PASTE INTO THE SLIDE

Layer	Technologies
Server	NestJS 11 · Prisma 5 · PostgreSQL 13 · Passport-JWT · Socket.IO 4
Client	React 19 · Vite 7 · TypeScript 5 · Ant Design 6 · TanStack Query 5 · Recharts 3 · Leaflet
Infrastructure	Docker Compose · nginx · GitHub Actions
External services	Groq (LLM) · Brevo (email) · Cloudinary (files) · Typeform (applications)

Row 5, Configurable LLM client: OpenAI-compatible; currently Groq running gpt-oss-120b. The provider URL and the model are settings, so changing provider is configuration, not a rewrite.

A11 · Slide 21

Use case diagram

NICE

Tenant admin has an arrow to **“Invoice and collect”**, which reads as if the renter issues invoices. Rename the use case *“Invoices and payments”*, or split it in two: *“Invoice and collect”* (Finance) and *“View and pay invoices”* (Tenant admin).

Also, in UML, the links between actors and use cases are usually plain lines, with no arrowheads. Some juries point this out.

The source is `docs/diagrams/01-use-case-global.puml`. I can edit and re-render it if you'd like; it isn't a Canva change.

A12 · Slide 24

The project in figures

MUST

Change the **43 audit probes** tile to **42**.

The banner says “Continuous integration green”. I couldn't check GitHub Actions from here. Open it the day before and make sure the last run on `main` is green.

A13 · Slide 25

What is finished

MUST

This slide lists “Reading of administrative documents” as finished, but slide 26 says the reading interface is “server only” and scans are “limited”. Make the AI bullet match:

PASTE INTO THE SLIDE (THIRD AI BULLET)

Server-side reading of administrative documents (trade licence, commercial registration); the upload interface comes next

If you add B6, change “Arithmetic consistency check (proving the isolation)” to “Arithmetic consistency check (slide 31)”.

A14 · Slide 26

What is not done yet

MUST

Scanned documents: “The configured AI provider exposes no vision model” is inaccurate. The provider is **Groq**, and Groq's documentation lists vision models. What's true is that the configured *model*, `openai/gpt-oss-120b`, reads text only.

External marketplaces and **Google Business profile** appear nowhere else in the deck. The adapters in `backend/src/marketplace` target **Coworker.com** and **LiquidSpace**, and their own code comment says the payloads follow a generic format that has to be adjusted to each vendor's API. So “adapters written” claims a little more than is done.

PASTE INTO THE SLIDE (THREE ROWS)

Outstanding	State	Reason
Scanned documents	Limited	The configured model (gpt-oss-120b) reads text only. Groq offers vision models, so this is a configuration change to test
External marketplaces	Waiting	Generic adapters for Coworker.com and LiquidSpace, to be matched to each vendor's API once access is granted
Production email	Degraded mode	Brevo needs the server's address allow-listed; fallback active

Google Business profile: keep this row only if you can say in one sentence what it would do for the landlord. Otherwise remove it.

A15 · Slide 29

Perspectives

NICE

Perspective 2 promises “a suite of injection tests”. You already have four prompt-injection probes against the public assistant in the audit script, and they pass. Say so, because it turns a promise into a continuation:

PASTE INTO THE SLIDE

A bounded assistant. Extend the conversational assistant to the renter's own data, and grow the four prompt-injection probes the public assistant already passes into a full suite.

PART B

New slides to add

Each one has a place in the new order (Part C), the text to paste, and the reason it's worth the time. Several of them were in your own content document and were dropped when you built the deck in Canva.

B1 · New slide 6, after the 02 divider

The business: leasing offices in Doha

MUST

The deck never says who the client is, which country it's in, or why the process happens face to face. Slides 9, 10, 16 and 21 all depend on that context. This content is from your own notes and from the note on your state diagram, which names Qatar.

PASTE INTO THE SLIDE

02 · CONTEXT

The business: leasing offices in Doha

A property company owns office towers and leases workspace to other businesses: private offices, dedicated desks, meeting rooms, event spaces.

The landlord	The renter	Operations staff
Owns the buildings. Lists, reviews, approves, invoices, collects.	Occupies the space. Books, signs, pays, reports faults.	Reception (calls, viewings), technicians, finance.

TWO RULES OF THIS MARKET

1. A lease is concluded **in person**: confirmation call, site visit, paper file, and only then a signature.
2. Rent is **not paid online**: cash, bank transfer or cheque.

The brief: one platform, from the first public enquiry to the collected rent, hosting several competing property companies on one installation.

Layout: three cards across the top, the two market rules as a highlighted strip underneath, the brief as one line at the bottom.

YOU FILL: ONLY YOU HAVE THESE FACTS

If there is a named client (the property company that asked for this), name it here. If Qatar is the *target market* rather than a signed client, say "target market".
Only add "today the work runs on spreadsheets, email and paper" if Mr Amri confirms it.

Say: *"These two rules are why nothing on the market fits. Keep them in mind, they come back in section 03."*

B2 · New slides 17–18: divider 05 + one slide

Work methodology and timeline

MUST

ESPRIT juries expect a slide on your method and a plan. Your "Progress" section also needs something to measure against: right now it lists totals, not progress.

WHY THIS ONE IS A TEMPLATE

I can't rebuild this from the repository: 83 of its 96 commits are dated September 2026, so the history doesn't show your real phases. Use your own records: supervisor meetings, your board (Trello, Jira, Notion), your weekly reports.

PASTE INTO THE SLIDE (FILL THE BRACKETS)

05 · WORK METHODOLOGY

How the work was organised

Left card — METHOD

[Scrum / Kanban / iterative] · [N]-week iterations · review with Mr Amri every [frequency] · backlog kept in [tool]

Right — timeline, one bar per phase, 15 Feb → [end date]

#	Phase	Dates
1	Study & specification: existing solutions, cahier des charges	[ ]
2	Design: use cases, class diagram, architecture	[ ]
3	Core platform: accounts, portfolio, catalogue & pricing	[ ]
4	Bookings & leases: the twelve-state workflow	[ ]
5	Billing, payments, maintenance, notifications	[ ]
6	Analytics, dashboards, AI features	[ ]
7	Isolation audit, tests, deployment	[ ]

YOU FILL: ONLY YOU HAVE THESE FACTS

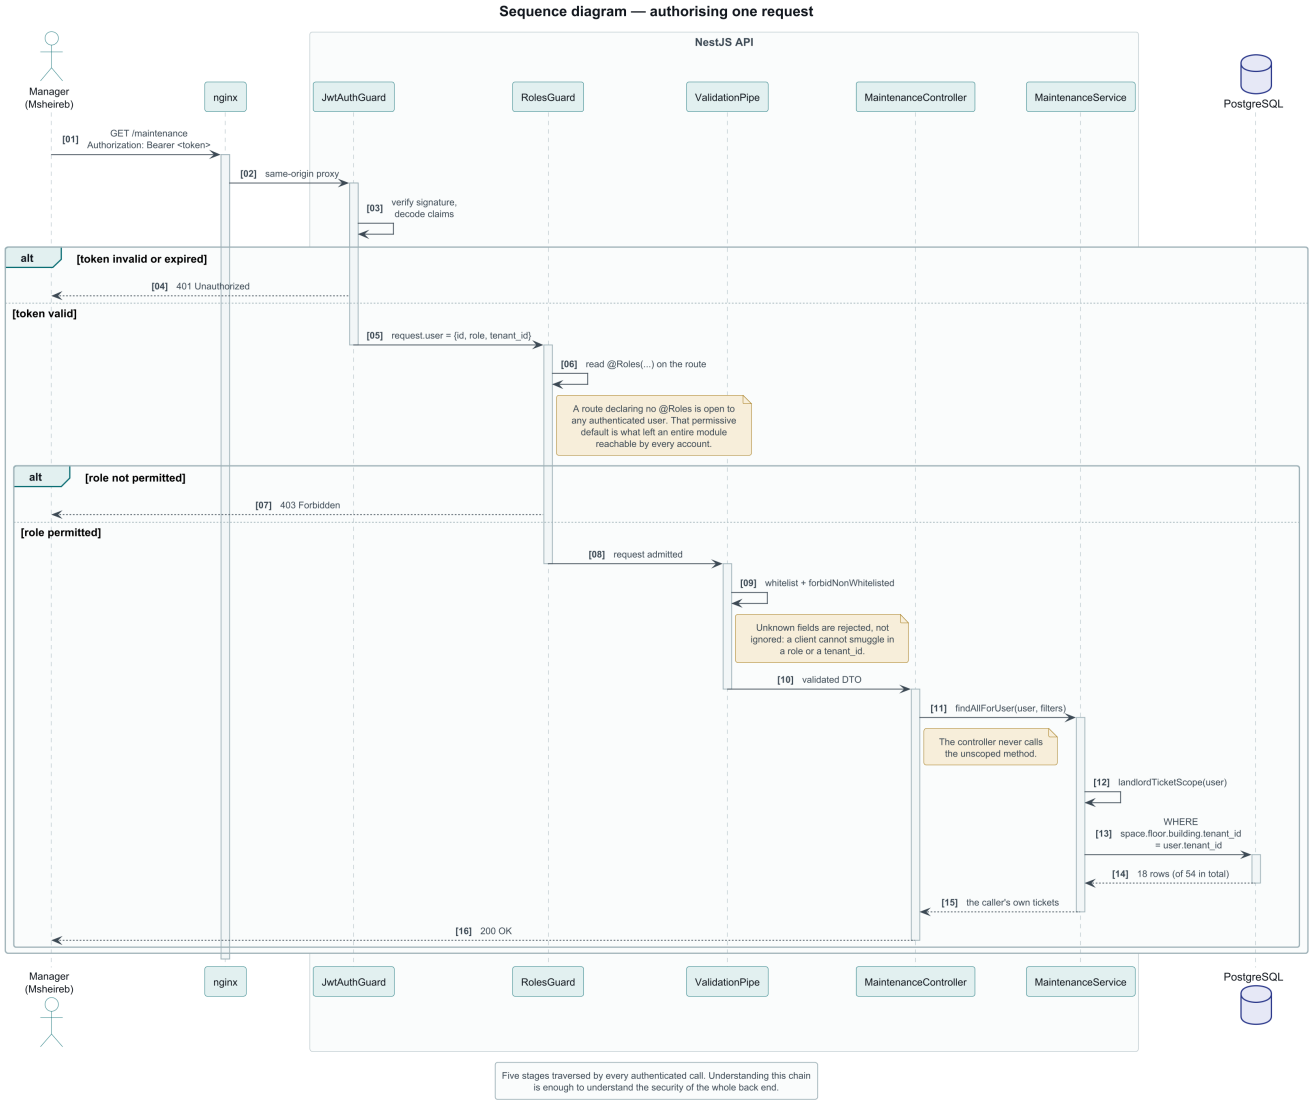

The phase names follow what's in the code. Reorder them to match what actually happened. Mark “today” on the bar. If phase 7 ran into September, extend the bar and say so (see A1).

B3 · New slide 15, after “One record, two owners”

How the rule is enforced, on every route

SHOULD

The section 04 divider says the model is “enforced on every route”, but no slide shows how. The diagram already exists: `docs/diagrams/04-sequence-authorisation.png` (landscape). To gain height on the slide, crop off the repeated row of participants at the bottom.

PASTE INTO THE SLIDE

How the rule is enforced, on every route

Five stages every authenticated call goes through:

#	Stage	What it does
1	JwtAuthGuard	Checks the token and identifies the caller
2	RolesGuard	Checks `@Roles(...)` on the route
3	ValidationPipe	Rejects unknown fields instead of ignoring them
4	Controller	Always calls the `*ForUser` method, never the unscoped one
5	AccessPolicyService	Turns the caller into a database filter

Banner: Only the platform owner reads across organisations. Everyone else is narrowed to their own organisation before the query is built.

Say: point at step 13, `WHERE space.floor.building.tenant_id = user.tenant_id`, which returns 18 rows out of 54. *"That is the landlord's path from slide 14, in one line."*

B4 · New slide 21, after the functional requirements

Where I departed from the specification

SHOULD

Your own content document called this *"the slide that decides your mark"*. It shows you reasoned about the specification instead of just following it, and it answers the most likely technical question before anyone asks it.

PASTE INTO THE SLIDE

Where I departed from the specification

The specification says	Decision	Why
Online payment (Stripe), marked optional	Dropped	This market settles in cash, transfer or cheque: a constraint given by the company supervisor
Supabase for authentication and storage	Passport-JWT, Prisma and Cloudinary instead	Row-level security would have to express both ownership paths as SQL policies on every table. One tested service, checked by an audit script, is easier to prove
BullMQ + Redis, marked optional	Not adopted	Three scheduled jobs: NestJS's own scheduler is enough, and that's one less component to run
QR check-in, recurrence, SLA	Not implemented	Marked optional in the specification

Footer: Added beyond the specification: three AI features · a public space-finding assistant · live notifications · an automated isolation audit

YOU FILL: ONLY YOU HAVE THESE FACTS

I checked the code side: Passport-JWT, Prisma and Cloudinary are in use, `@nestjs/schedule` runs three `@Cron` jobs, and there's no Supabase or BullMQ dependency. The specification isn't in the repository, so check every left-hand cell against your cahier des charges.

WATCH OUT

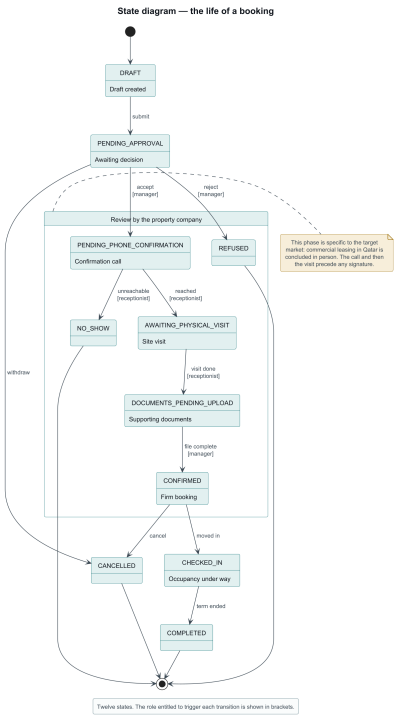

I reworded the Supabase reason from your notes. "Row-level security reasons about one tenant id" can be challenged: RLS policies are SQL and can use joins. The point you can defend is cost and testability, not that it's impossible.

B5 · New slide 28, after the class diagram

The life of a booking

SHOULD

“Twelve states, not four” (slide 16) is your clearest proof that you modelled a real market. The state diagram shows it, along with the role that triggers each step: `docs/diagrams/07-state-booking.png`.

It's a **portrait** (tall) image. Put it on the left third of the slide at full height, with the text on the right. Or ask me to re-render it left to right for a 16:9 slide.

PASTE INTO THE SLIDE

The life of a booking

Twelve states. The role allowed to trigger each transition is in brackets.

The boxed phase (call, visit, documents) is the face-to-face process from slide 6. It's also why the receptionist exists.

The server checks the current state before every move: a booking can only follow an arrow.

B6 · New slide 31, after “The project in figures”

Proving the isolation

SHOULD

Slide 25 mentions an “arithmetic consistency check” in a single bullet. It's your most convincing evidence and it deserves its own slide. I checked every number below against the running API on 7 October 2026, signed in as each landlord and as the platform owner.

PASTE INTO THE SLIDE

Proving the isolation

Measure	Msheireb	West Bay	Lusail	Platform owner
Revenue collected, last 30 days (QAR)	5,300	11,800	10,100	**27,200**
Bookings	6	6	6	**18**
Spaces	24	24	24	**72**
Maintenance tickets	18	18	18	**54**

Banner: The three portfolios add up exactly to the platform total. If a row leaked into the wrong portfolio, it would be counted twice and the sum would not close.

Footnote: Demonstration data: three property companies, six renter companies.

WATCH OUT

The revenue figures will change before you present. The revenue KPI counts paid invoices from the **last 30 days**, so invoices drop out as the days pass. Re-read the four dashboards (platform owner and the three managers) the day before, and update the first row. The other three rows don't depend on dates.

Msheireb Properties is the name of a real Qatari developer. On a slide, it can look as if they're your client. Keep the "demonstration data" footnote, or rename that company in the seed before the defense. I can do that; it needs a reseed.

Say: do the first row aloud. *"Five thousand three hundred, plus eleven thousand eight hundred, plus ten thousand one hundred: twenty-seven thousand two hundred."* It takes six seconds.

B7 · New slide 32

One of the nine defects, concretely

SHOULD

Slides 13 and 28 talk about nine defects but never show one. This one, from commit `b9aac44` (14 September), illustrates slide 28 exactly: a call site with its own copy of the rule instead of asking the shared service.

PASTE INTO THE SLIDE

One of the nine: finance could read another landlord's bookings

Before `booking.service.ts`

```
if (user.role === USER_ROLE.SUPER_ADMIN ||
    user.role === USER_ROLE.FINANCE) {
  if (opts.tenantId) where.tenant_id = opts.tenantId;
  // otherwise: no filter at all, every organisation's bookings
}
```

After

```
// only the platform owner reads across organisations
if (user.role === USER_ROLE.SUPER_ADMIN) { ... }
else if (MANAGER || CLIENT_ADMIN || FINANCE) {
  where.space = { floor: { building: { tenant_id: user.tenant_id } } };
}
```

The service kept its own list of who may read across organisations, instead of asking `AccessPolicyService`. **Found by the audit script, not by reading code.**

Layout: the two code blocks side by side, with the changed lines highlighted. Use a monospace font at 16 pt or larger, and cut the code down further if it doesn't fit at that size.

B8 · New slide 35, end of section 09

Live demo

MUST

Your deck has 55 pages of application and not one screenshot. A first review is where the jury wants to *see* it working. You already have a rehearsed script: `docs/PFE_DEMO_SCRIPT.md` (four acts, about 12 minutes with talking).

PASTE INTO THE SLIDE

09 · PROGRESS & DEMO

Live demo

1 · A landlord's day: application → call → visit → documents → lease
2 · Two competitors side by side: same screen, different data
3 · The renter: book, pay, report a fault

Which acts to show: the full script is Act 1 (platform owner, 2 min), Act 2 (property manager, 4 min), Act 3 (isolation proof, 2 min), Act 4 (renter, 2 min). If time is short, show Act 3 and the reception part of Act 2.

Backup if the live demo fails: one slide with four screenshots (X4 in Part D).

PART C

The new running order

39 slides, ten of them three-second dividers. Times are speaking estimates, not counting dividers.

#	Slide	Status	Time
1	Title	FIX · A1	0:20
2	Agenda	FIX · A2	0:15

37	The finding worth taking away	**KEEP**	0:45
38	Perspectives	**FIX · A15**	0:45
39	Questions	**KEEP**	
X1–X4	Backup slides (Part D)	**NEW**	only if asked

IF YOU'RE OVER TIME

The full version runs about **24–26 minutes** including a 4-minute demo. Your previous plan aimed at about 18 minutes of content. If your slot is shorter, cut in this order. Each cut slide moves to the backup section after Questions, so it's still there if someone asks:

- **B5** The life of a booking (−0:45): slide 20 already states the twelve states
- **B7** One of the nine (−0:45): ideal answer to “give me an example”
- **B4** Departures from the specification (−1:00): it's the most likely question, so keep it ready
- Merge **the question** and **the three difficulties** into one slide (−0:30)
- Shorten the demo to Act 3 only (two tabs, the isolation proof)

YOU FILL: ONLY YOU HAVE THESE FACTS

Check how many minutes the first review allows, and whether the demo counts towards that time.

PART D

Demo day, backup slides and likely questions

What to do before you walk in, what to keep after the Questions slide, and what you're likely to be asked.

BEFORE THE ROOM

- `docker compose up -d --build`, then wait until **api** and **postgres** show *healthy* in `docker compose ps`.
- Run `npm run audit:access` **once**, an hour or more before. Running it again within a few minutes trips the rate limiter, and the four prompt-injection checks show FAIL (HTTP 429).
- **Re-read the dashboard figures you plan to quote.** Your demo script says “43,500 QAR collected” for the platform. On 7 October the API's revenue KPI for the platform owner was 27,200 QAR (paid invoices, last 30 days). Either it's a different measure or it's out of date. Check before you say it, and update B6 at the same time.
- Open GitHub Actions and check that the last run on `main` is green (slide 30 says so).
- Open **two browser tabs**, a landlord manager and a renter. Sessions are per tab, so you can switch between them without logging out.
- Have the screenshots slide (X4) ready in case the live demo fails.

BACKUP SLIDES, AFTER “QUESTIONS”

X1 · Backup

The 42 isolation checks

NICE

If someone asks what the probes actually test. Counted from the script and from a live run on 7 October 2026:

PASTE INTO THE SLIDE

What is checked	Checks
Reads: no rows from another organisation (bookings, invoices, payments, leases, tickets, notifications, revenue)	7
Reads: a forged `tenantId` is refused	3
Endpoints a renter must not reach at all (users, organisations, audit, exports, mail settings…)	8
Writes against another organisation refused (2 accounts × 4 writes)	8
Landlord vs landlord: buildings, tickets, opening each other's ticket, KPI totals	9
Public assistant: 4 prompt-injection attempts, the map, a forged system message	6
Privilege escalation: self-promotion to SUPER_ADMIN	1
Total	**42**

X2 · Backup

The nine defects, one line each

NICE

Every jury that hears “nine defects” can ask “which ones?”. Have the list ready.

YOU FILL: ONLY YOU HAVE THESE FACTS

Build this list from your own notes. Commits and defects don't match one to one: commit `2b05344` alone fixes four leaks. Make sure the list really adds up to nine, or change the number on slides 14, 33 and 37. Starting points in the git history:

Commit	Date	Subject
`c9b3bae`	10 Sep	Scope promotion codes to their owning tenant
`f7d09bc`	11 Sep	Check ownership before writing uploaded files
`320f605`	11 Sep	Scope notifications, mail and search to the caller
`630e5ee`	11 Sep	Close cross-tenant gaps in the application workflows
`dd9227d`	11 Sep	Scope billing to the caller, and cover booking
`fbdae10`	11 Sep	Scope the remaining modules, settle what FINANCE may read
`6476d27`	13 Sep	Apply the tenant filter the dashboards already computed
`b9aac44`	14 Sep	Finance at one property company could list another's bookings
`2b05344`	21 Sep	Confine maintenance and analytics to one property company (four leaks)

X3 · Backup

The full class diagram

NICE

`docs/diagrams/02-class-diagram.png` (17 classes). Too dense for the talk, but useful if the jury asks about an entity that isn't on the simplified version.

X4 · Backup

Four screenshots, in case the demo fails

NICE

- The public map with the space-finding assistant
- Reception: a booking moving through call, visit and documents
- A landlord's dashboard with the KPI cards
- A maintenance ticket showing the AI triage suggestion (category, priority, technician)

LIKELY QUESTIONS, AND WHERE YOUR ANSWER IS

Question	Short answer
Nexudus and OfficeRnD already host thousands of competing operators. What's new?	The nested level: a renter company is an organisation of its own, below the landlord, and a booking has two owners (slides 13–14, A5).
Why not Supabase and row-level security?	Both ownership paths would have to live in SQL policies on every table. One tested service plus an audit script is easier to prove (B4).
Why no online payment?	A market constraint given by the company supervisor. Payments are recorded by named staff, with an audit trail (slide 20).
How do you know the isolation actually holds?	42 probes against the running API, the arithmetic partition, 252 unit tests (B6, X1).
What if the LLM is down, or makes something up?	Values outside the app's own list are discarded and a keyword classifier takes over. The technician comes from ticket history, never from the model (slide 33).
Why are landlords called “tenants” in your code?	Software sense of the word; `organization_type` tells them apart (A6).
Is Msheireb Properties your client?	No, it's demonstration data (B6).
Why is Adminer in your stack?	Development only; it's not in the production compose file (A8).

Question	Short answer
What does the receptionist do that a manager can't?	Moves a booking through the phone call and the site visit (B5).
Can a user change their own role?	No. The self-promotion probe confirms the role stays unchanged (X1).
How do you prevent double booking?	An overlap check before the write, not a warning afterwards (slide 20).
